

## Output for weighted analyses

There are a number of things missing from the output when design weights are used in HLM 6.0. This is because of the new weighting scheme, and we didn't get everything done before we released version 6.0.

The missing output is:

- no "regular" fixed effects table. Only the robust s.e.'s table is output;
- no reliabilites for tau;
- no beta(hats) (i.e. OLS estimates) available in hlm2.
- no s.e.'s are available for  $\sigma^2$  or tau(s). A related side effect is that mlf is not available in hlm2 when design weights are used;

This information will appear in version 6.01, which will be made available as a free downloadable patch file.
